

# Server-Client Data Flow Diagram

Griffin Moyer | April 5, 2023

My plan is to have a Data object that stores signal data. It will store an Instruct enumeration telling what kind of signal it is, and then store an object(s) with the data needed to be recieved. Both the client and server will have an object stream that recieves Data objects. The reciever will switch the enumeration to determine how to cast the sent object(s).
